Progress in Scale Modeling Kozo Saito,2008-08-20 Scale modeling can play an important role in R&D. When engineers receive some ideas in new product development, they can test how the new design looks by building scale models and they can get an actual feeling with the prototype through their imagination. Professor Emori often said: "When children play with a toy airplane, their mind is wondering about the prototype airplane which they haven't ridden. " Children can use the scale model airplane as a means to enter into an imaginative world of wonder by testing in their own way how the actual airplane might function, how the actual airplane can maneuver aerodynamically, what might be the actual sound of a jet engine, how to safely land the actual airplane, and so on. This imagination that scale models can provide for children will help them later develop professional intuition. Physical scale models can never be entirely successfully replaced by computer screens where virtual models are displayed and fancy functions are demonstrated. Not only children but also adults can learn things by actually touching things only offered by physical models, helping all of us develop imagination and feeling eventually leading toward Kufu. Einstein's famous "thought experiments [11]," which helped him to restructure modern physics may possibly and effectively be taught by letting researchers play with scale models! References 1. I. New American TQM Shōji Shiba, Alan Graham, David Walden, 1993-08 The benefits of applying TQM in manufacturing are well-known: eliminating product defects, enhancing product design, speeding delivery, and reducing costs. Most people readily agree with the basic premise of TQM, but how many have been able to implement it successfully? What makes it so difficult for TQM to permeate a company? How can an approach to corporate management first developed in Japan take root and flourish in the very different corporate climate of the U.S.?

Four Practical Revolutions in Management Alan Graham, Shoji Shiba, David Walden, 2001-04-24 In *Four Practical Revolutions in Management: Systems for Creating Unique Organizational Capability*, authors Shoji Shiba and David Walden significantly revise their classic text on leading management systems -- *A New American TQM*. This book is a comprehensive approach to business management that goes beyond business operations improvement. The authors demonstrate a program for establishing a sophisticated, state-of-the-art management system that creates unique organizational capabilities. Containing new methodologies and case studies, the book is one of the most extensive in the management field and provides a step-by-step program for implementing leading management techniques. To create a successful management system, the authors argue that companies must be organized around four major areas of practice called the four revolutions. They are customer focus, continuous improvement, total participation, and societal networking. For each of the areas, the book presents proven methods that enable dynamic implementation strategies. Customer Focus Any effective management system

begins with the customer. Companies must learn to integrate a customer's concerns into their own. The book presents how to embrace the market-in concept and integrate the other skills in the book into a management strategy that focuses on the customer. Continuous Improvement For a company to be successful in the 21st century, it must continually improve its processes to meet the ever-changing needs of the customer. This book introduces important tools for process discovery, management, and improvement. In the process, it moves beyond reactive improvement methods to proactive improvement efforts. Total Participation The key to creating a dynamic management system is employee participation. Employees are the ones who work on the issues of quality and customer satisfaction on a daily basis. This book presents skills such as hoshin management, team-building, creating structures for mobilization, and leading change and breakthrough. Societal Networking Besides a company's internal audience, another source of business improvement ideas is societal networking. This is the set of companies, customers, and suppliers associated with any organization, that can learn from the experiences of these groups. To develop these valuable resources into a comprehensive management strategy, the book covers mutual learning methods, as well as keys for integrating various management methodologies. This book includes: Hoshin management PDCA (plan, do, check, act) cycle 7-step method of reactive improvement Proactive improvement to develop new products Engaging people in a changing environment Focused strategies for phase-in Leading process improvement The practice of breakthrough Over thirty thorough case studies

Arming the Luftwaffe Daniel Uziel,2011-11-16 During World War II, aviation was among the largest industrial branches of the Third Reich. About 40 percent of total German war production, and two million people, were involved in the manufacture of aircraft and air force equipment. Based on German records, Allied intelligence reports, and eyewitness accounts, this study explores the military, political, scientific and social aspects of Germany's wartime aviation industry: production, research and development, Allied attacks, foreign workers and slave labor, and daily life and working conditions in the factories. Testimony from Holocaust survivors who worked in the factories provides a compelling new perspective on the history of the Third Reich.

Robotics and Automation in Construction Carlos Balaguer, Mohamed Abderrahim, 2008-10-01 This book addresses several issues related to the introduction of automaton and robotics in the construction industry in a collection of 23 chapters. The chapters are grouped in 3 main sections according to the theme or the type of technology they treat. Section I is dedicated to describe and analyse the main research challenges of Robotics and Automation in Construction (RAC). The second section consists of 12 chapters and is dedicated to the technologies and new developments employed to automate processes in the construction industry. Among these we have examples of ICT technologies used for purposes such as construction visualisation systems, added value management systems, construction materials and elements tracking using multiple IDs devices. This section also deals with Sensorial Systems and software used in the construction to improve the performances of machines such as cranes, and in improving Human-Machine Interfaces (MMI). Authors adopted Mixed and Augmented Reality in the MMI to ease the construction operations. Section III is dedicated to describe case studies of RAC and comprises 8 chapters. Among the eight chapters the section presents a robotic excavator and a semi-automated façade cleaning system. The section also presents work dedicated to enhancing the force of the workers in construction through the use of Robotic-powered exoskeletons and body joint-adapted assistive units, which allow the handling of greater loads.
